Adult Activity Bundle of 25 Games

Including math games, word searches, dot to dot, spot the difference, sudoku, mazes and so much more

Your task is to fill every empty cell with a positive or negative integer so that each white cell's value equals the sum of its adjoining 2 cells. Then the grid will "balance" itself in such a way so that the four center cells surrounding the center "zero cell" will always add up to zero.

The gray cells must include all integers between -16 and 16, except 0
No number can be repeated within any of the gray cells.
The number in each white cell must equal the sum of its adjoining cells.
The center Zero cell is always the sum of all four adjacent cells.

** Numbers can (and will) be reused across both white and gray cells. The rules specify only that the -16 to 16 numbers can never be used more than once in the gray cells. Example is here:

	-7						-3	
1		3			20			-12
15								8
-15								-9
						19		
	-13						21	10
-7				0				
2	-11							
		5						6
13			-5				-5	5
-14								
						-2		-2
-1								
	-12						-12	
								-16
